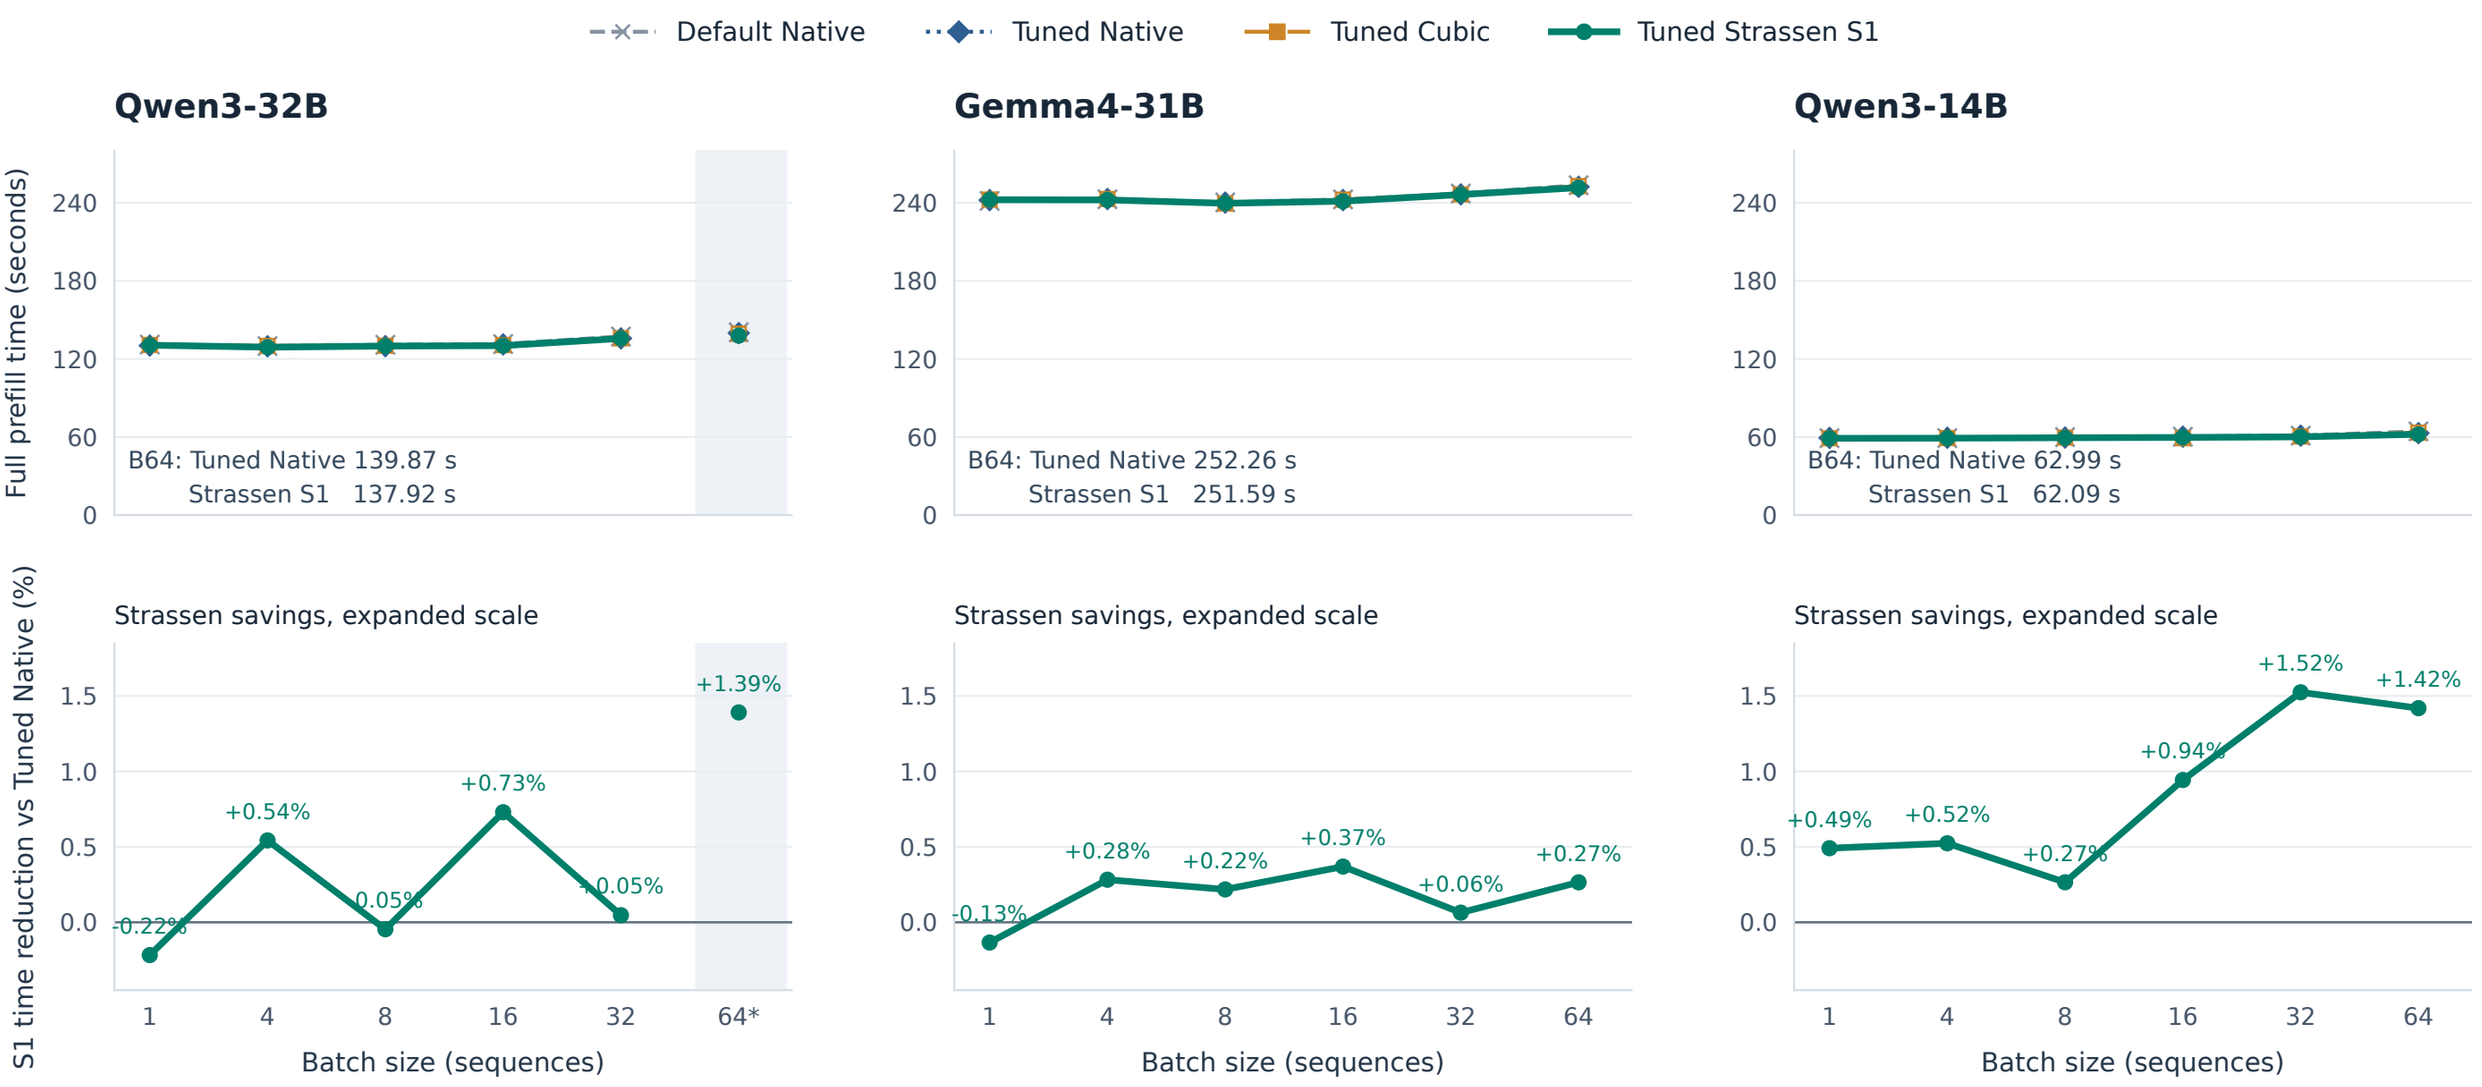
Full offloaded prefill shows much smaller gains

Complete cached-disk-offloaded passes, including preparation and recurring transfers | Mean of 3 measured passes per arm



Scope: cached reads, common packing/preparation, H2D, embeddings, all decoder layers and last-position logits; no decode or initial downloads.

Common preparation includes Strassen packing for every arm. Small differences from 3 passes are descriptive, not established deployment gains.

* Qwen3-32B B64 uses a newer compiler stack; it is not joined to B32. Within-batch algorithm comparisons are matched.
